

CORPORATE WEBSITE FEATURE & SCOPE

MINING & COMMODITIES

TRADING COMPANY

Premium, credible, conversion-focused website
with an industrial black & gold visual identity

Prepared for website planning and implementation

1. Executive Summary

The website should present the company as a credible international minerals and commodities trading partner. The primary job of the site is not to behave like a complex application; it should clearly communicate what the company trades, how it delivers, why buyers can trust it, where it operates, and how to start a business conversation.

Recommended direction: a premium, mostly static corporate website with strong photography/video, subtle motion, interactive project/operations storytelling, clear calls to action, and a frictionless contact/WhatsApp path. A database or full CMS is not required for the first release unless the company later needs staff to update content themselves.

Brand colors	Black + Gold; use off-white for readable content sections and restrained gold accents for premium emphasis.
Language	English only. Clear business English with short, scannable copy.
Core business	Trading, sourcing and supply of minerals and commodities, with end-to-end logistics/documentation support.
Leadership display	Director and top-management list only; no individual profile pages requested.
Assets	Company logo, company/mineral photos and official contact details are already available and should be used as primary visual assets.

2. Business Proposition to Communicate

The website copy should make the company value proposition immediately understandable:

“We source and supply minerals and commodities to customer requirements, while managing quality verification, documentation, logistics, export, shipping and final delivery.”

This should become the core narrative running through the homepage, services pages and enquiry experience.

Core commodities stated by the company

• Copper Cathode	• Copper Concentrate	• Copper Wire
• Cobalt	• Tantalite	• Coltan
• Gold	• Sulfur	• Other customer-requested minerals

3. Recommended Website Structure

A simple structure keeps the experience easy to navigate while still giving the company room to demonstrate capability and credibility.

HOME	Hero, value proposition, commodities, process, trust signals, operations/story, CTA
ABOUT	Company overview, mission/values, leadership list, operating approach
COMMODITIES	Mineral/commodity catalogue with product-specific information
SERVICES	Sourcing, quality verification, documentation, logistics, export, shipping, delivery
OPERATIONS	Interactive map / origin-to-destination journey / operating locations
PROJECTS / SOURCING	Optional showcase of sourcing regions, supply programs or active opportunities
RESPONSIBILITY	Quality, compliance, responsible sourcing, safety/community commitments - only where supported by company facts
MEDIA	Company/mineral gallery, selected news or updates, downloadable brochure
CONTACT	Smart enquiry form, WhatsApp, phone, email, address, social links

4. Premium Features That Make the Website Feel Genuine

These features are recommended because they reinforce a mining/commodities business story. They should explain something or build trust - not exist only as decoration.

Cinematic Hero Video Use real company/mineral/operations footage or a short drone clip behind a strong statement. Muted autoplay; fast load; still-image fallback on mobile or slow connections.	Interactive Operations Map Show sourcing/operation regions and allow visitors to click locations to discover relevant commodities, capabilities or project information.
Origin-to-Destination Journey Animate the company process: Sourcing -> Quality Verification -> Documentation -> Logistics -> Export -> Shipping -> Final Delivery.	Commodity Showcase Present each major commodity with a refined product card, imagery, concise description and "Request Supply / Enquire" action.
Interactive Mineral Story Use geological contour-line animation or a subtle mineral/ore visual motif to connect the design to the mining industry.	Project / Supply Timeline For selected sourcing programs or supply opportunities, show stages such as sourcing, verification, preparation and delivery.
Before / After Visual Slider Use only where the company has authentic imagery - for example site preparation, facility improvements or environmental/community work.	Animated Company Facts Reveal verified figures such as years of experience, active commodities, regions served or supply milestones. Do not invent metrics.
Premium Micro-interactions Magnetic buttons, image zoom, line-draw effects, smooth card transitions, scroll progress and subtle section reveals.	WhatsApp Business CTA One-tap WhatsApp contact with a prefilled business enquiry message. Particularly useful for buyer and supplier conversations.
Corporate Profile Download Provide a polished company profile PDF for buyers, partners, investors and procurement teams.	Trust / Verification Area Show authentic licenses, certifications, memberships or compliance statements supplied by the company. Link each to supporting evidence when appropriate.

5. Homepage Experience - Recommended Flow

01	HERO	Large company/mining visual + positioning statement + primary CTA
02	TRUST STRIP	Selected commodities / operating regions / verification cues
03	WHAT WE DO	Short explanation of sourcing, supply and end-to-end execution
04	COMMODITIES	Copper, Cobalt, Tantalite, Coltan, Gold, Sulfur and other requested minerals
05	HOW WE DELIVER	Animated six-step origin-to-destination process
06	OPERATIONS / MAP	Interactive regions and sourcing/origin story
07	WHY US	Quality, reliability, efficient execution, documentation and delivery
08	VISUAL PROOF	Real company photos, minerals, logistics and operations
09	LEADERSHIP	Director + top management names in a clean corporate list
10	FINAL CTA	Request supply / discuss a requirement / WhatsApp / email / phone

6. Commodity Catalogue - UX Recommendation

The commodity section should feel like a professional trading catalogue, not an e-commerce store. The goal is to help a serious buyer identify whether the company can source and supply the required material.

Commodity Card	Name + image + short description + origin/availability statement where approved + enquiry CTA.
Product Detail	Common name, material/grade information only where verified, typical supply form, sourcing approach, documentation/quality process and enquiry CTA.
Buyer Action	“Request Availability”, “Request Supply” or “Discuss Requirement”. These are stronger B2B actions than “Buy Now”.
No Unverified Claims	Do not publish assay percentages, grades, certificates, reserves, quantities or origins unless the company has supplied verified information.

Recommended enquiry path

Visitor selects commodity	Views concise information	Clicks Request Supply	Chooses enquiry type	Sends via form / WhatsApp / email
---------------------------	---------------------------	-----------------------	----------------------	-----------------------------------

7. Confirmed Leadership & Management Display

The website should display a concise leadership list as requested. No individual biographies are required for this release.

Director	Tshepo Zwelibanzi	+27 78 963 8042
PR	Dan Guguka	+255 750 471 188
Financial	Hans Mtui	+255 619 685 942

Contact experience

Use a persistent “Contact / WhatsApp” action on desktop and mobile. The contact page should include official phone, email, WhatsApp, office address and social media provided by the company. The final form fields should remain short: Name, Company, Email/Phone, Enquiry Type, Commodity of Interest, Message.

8. Recommended Technical Approach

Because the first release is primarily informational and visual, a backend/database is not necessary. A static or static-first architecture will be fast, secure and inexpensive to host while still allowing all major experience features.

Frontend	Next.js / React with Tailwind CSS for the responsive interface.
Animation	Framer Motion and/or GSAP for high-quality scroll and micro-interactions. Keep motion subtle and accessible.
Maps	Mapbox or Leaflet if an interactive operations map is approved.
Media	Optimized WebP/AVIF imagery, compressed video, responsive images and lazy loading.
Deployment	Cloudflare Pages/Workers, Vercel or another static-friendly platform; Cloudflare can also provide DNS/CDN/WAF.
Data	No application database for the initial release. Content can be compiled into the site during deployment.
Future upgrade	Introduce a CMS/database only when company staff need to update commodities, projects, news, vacancies or documents without developer involvement.

9. Professional Quality Requirements

Mobile-first	The site must work exceptionally well on phones, including WhatsApp contact and fast-loading imagery.
Performance	Optimize large media, avoid heavy unneeded 3D effects, lazy-load below-the-fold assets and target excellent Core Web Vitals.
Accessibility	Readable contrast, keyboard navigation, reduced-motion support, semantic headings, alt text and accessible forms.
SEO	Clean metadata, Open Graph previews, descriptive URLs, structured content and sitemap/robots setup.
Trust	Never invent certifications, quantities, mining licences, locations, resource numbers or commercial claims. Everything factual must come from the company.
Security	HTTPS, security headers, protected contact endpoints and rate limiting on any public form or API endpoint.
Analytics	Optional privacy-conscious analytics to measure visits, commodity interest and enquiry conversions.

10. Scope Priorities

To avoid overbuilding, the work can be divided into a strong first release and optional enhancements.

	• Premium homepage • About + leadership list • Services / end-to-end process • Commodity catalogue • Contact + WhatsApp • Gallery • Responsive design • SEO + performance + security
	• Interactive operations map • Cinematic hero video • Animated origin-to-destination journey • Animated company facts • Corporate brochure download • Trust/certification area
	• CMS for staff updates • News management • Advanced project management • Supplier/buyer portal • Quotation workflow • CRM integration • Document portal

Design principle

The final website should feel premium because of clarity, authenticity, imagery, typography and controlled motion - not because every section is animated. The visual identity should communicate reliability, scale and professionalism.

11. Content & Assets Checklist

The following items should be collected/confirmed before implementation is finalized.

OK	Official logo files (preferably SVG/PNG with transparent background).
OK	Official phone, email, WhatsApp, office address and social links.
OK	High-resolution company/site/mineral/logistics photographs.
OK	Any approved drone or operations video footage.
OK	Final company overview and approved marketing copy.
OK	Confirmed list of commodities and approved descriptions.
OK	Confirmed sourcing/operating countries or regions that may be published.
OK	Any licenses, certifications, memberships or compliance materials the company wants displayed.
OK	Company profile PDF, brochures or approved documents.
OK	Final leadership names/titles and confirmation of public contact details.

12. Final Website Concept

The finished product should feel like the online headquarters of a credible minerals trading company: sophisticated black and gold branding, authentic mining imagery, clear commodity information, a strong explanation of the end-to-end supply process, visible management, and a fast path from interest to business enquiry.

The strongest “wow” factor should come from interactive storytelling: a buyer can discover what the company supplies, understand how material moves from origin to destination, explore operating/sourcing regions, see authentic visual proof, and then contact the company in one or two steps.

Proposed positioning line examples

“Reliable Mineral Supply. From Source to Destination.”

“Sourcing Resources. Delivering Value.”

“Global Commodity Supply, Executed with Confidence.”

Note: These are creative options, not approved company claims. Final wording should be selected with the company.
